Bank Transfer Test Plan — OPay Android Application

Document Control

Field	Details
Test Plan ID	QA-01-OPY-TP-001
Candidate/Tester	Uthman Adewale
Fellow ID	FE/23/7640933
Track	Quality Assurance
Brief ID	QA-01
Project Title	Bank Transfer Test Plan
System Under Test	OPay Android Application
Application Version	8.12.1.474
Test Device	Samsung Galaxy S21+
Operating System	Android 12
Transfer Under Test	Transfer from OPay to another Nigerian bank account
Testing Type	Manual black-box functional testing
Document Version	1.1
Status	Revised Draft for Approval
Date	13 August 2026

1. Purpose

This test plan defines the approach for assessing the bank-transfer flow in OPay version 8.12.1.474 on a Samsung Galaxy S21+ running Android 12.

The selected journey begins when an authenticated user selects **To Bank** from the OPay home screen. It continues through recipient entry, bank selection, amount entry, transaction review and Payment PIN authorization. It ends when the transaction outcome and corresponding History record are verified.

The assessment will determine whether OPay preserves the correct recipient, destination bank, amount, fee and payment information throughout the selected transfer journey.

This is an independent educational quality-assurance assessment conducted through the tester's authorized OPay account. It is not commissioned, sponsored or endorsed by OPay.

2. Confirmed Test Basis

This plan is based on seven screenshots captured from the tester's installed OPay application.

The screenshots confirm the following:

- OPay version 8.12.1.474.
- Samsung Galaxy S21+ running Android 12.
- To Bank on the authenticated OPay home screen.
- Transfer to Bank Account as the transfer screen.
- Enter 10 digits Account Number.
- Select Bank.
- Next.
- Recipient name, masked account number and destination bank display.
- Transfer range of ₦100.00–₦5,000,000.00.
- Preset amounts of ₦500, ₦1,000, ₦2,000, ₦5,000, ₦9,999 and ₦10,000.
- Optional Remark field.
- Purchase and Personal remark options.
- Confirm.
- Reminder screen.
- Recheck and Continue.
- Payment-review information showing the bank, account number, recipient name, amount, fee and payment method.
- Pay.
- Use Payment PIN.

The supplied screenshots do not yet confirm:

- The exact validation messages produced by invalid inputs.
- The screen displayed after successful payment.
- The appearance of a failed or pending transaction.
- The transaction receipt.

- The final History record.

These behaviours will not be described as confirmed until they are observed during controlled test execution.

3. Test Objective

The objective is to determine whether an authenticated OPay user can complete the selected bank-transfer journey accurately and receive a clear, consistent transaction outcome.

Testing will verify whether:

1. The account-number field enforces the required 10-digit format.
2. The user must select a destination bank before proceeding.
3. OPay resolves and displays the recipient's name before payment.
4. The displayed recipient belongs to the entered account number and selected bank.
5. OPay applies the displayed amount range of ₦100.00–₦5,000,000.00.
6. The preset amount buttons populate the correct amount.
7. The optional Remark field can be used or left empty.
8. Recipient, bank and amount information remains consistent across the entry, Reminder and payment-review screens.
9. Any applicable fee is displayed before payment authorization.
10. OPay prevents transfer submission until Payment PIN authorization is provided.
11. A single authorized payment produces only one observable transaction outcome.
12. The final transaction information agrees with the corresponding History record.

4. Observed Transfer Journey

The screenshots establish the following test journey:

1. The authenticated user selects To Bank from the OPay home screen.
2. OPay opens Transfer to Bank Account.
3. The user enters a recipient account number under Enter 10 digits Account Number.
4. The user chooses the destination institution through Select Bank.
5. The user selects Next.
6. OPay displays the resolved recipient name, masked account number and destination bank.
7. The user enters an amount within the displayed range of ₦100.00–₦5,000,000.00 or uses a preset amount.
8. The user may leave Remark empty, type a remark, or select Purchase or Personal.
9. The user selects Confirm.
10. OPay displays a Reminder containing the recipient name, account number, destination bank and amount.

11. The user may select Recheck to review or modify the information.
12. The user selects Continue to open the payment-review screen.
13. OPay displays the bank, account number, recipient name, amount, fee, payment method and available funding information.
14. The user selects Pay.
15. OPay requests authorization through Use Payment PIN.
16. The transaction outcome and History record will be documented during execution.

5. Test Scope

5.1 In Scope

Testing is limited to the direct account-entry transfer journey from OPay to another Nigerian bank account.

The assessment will cover:

- Opening To Bank from an authenticated session.
- Entering the recipient's 10-digit account number.
- Selecting the destination bank.
- Using Next to continue.
- Recipient-name resolution.
- Verification of the recipient name, masked account number and bank.
- Entering an amount manually.
- Using the displayed preset amounts.
- Pre-payment validation of the displayed ₦100.00 minimum.
- Pre-payment validation of the displayed ₦5,000,000.00 maximum.
- Validation of amounts outside the displayed range without authorizing payment.
- Leaving Remark empty.
- Entering a short, non-sensitive remark.
- Selecting Purchase and Personal.
- Selecting Confirm.
- Checking the transaction information on the Reminder screen.
- Using Recheck to return to the previous screen.
- Using Continue to open the payment-review screen.
- Comparing recipient, bank and amount information across the relevant screens.
- Verifying the displayed fee and payment method.
- Confirming that Payment PIN authorization is required.
- Completing one controlled low-value transfer.
- Recording the naturally occurring transaction outcome.
- Checking the corresponding History record.
- Confirming that one intentional authorization produces only one recorded transfer.

- Safely checking application behaviour if connectivity is unavailable before Payment PIN authorization.

The ₦5,000,000 maximum will only be tested at the input and validation stage. A ₦5,000,000 transaction will not be authorized.

5.2 Out of Scope

The following are excluded:

- OPay registration and login.
- OPay-to-OPay transfers.
- Recipient selection through Recents or Favourites.
- Withdrawals.
- Airtime, data, betting, television and bill payments.
- Loans, savings, rewards and card services.
- International transfers.
- Repeated invalid Payment PIN attempts.
- Payment PIN lockout testing.
- Fraud-control testing.
- Direct access to or testing of OPay APIs.
- Penetration or vulnerability testing.
- Load, stress or performance testing.
- Automated submission of live financial transactions.
- Deliberate attempts to cause duplicate debits.
- Deliberate interruption after Payment PIN authorization.
- Use of another customer's authentication information.

Recents and Favourites are visible on the transfer screen, but they are excluded because the selected journey begins with direct entry of an account number.

6. Test Approach

Testing will use a manual black-box approach. The assessment will be based only on inputs entered through the OPay interface and the responses displayed by the application.

OPay Element	**Test Technique**	**Assessment Focus**
Account-number field	Equivalence partitioning	Blank, incomplete, valid 10-digit and structurally invalid inputs
Destination bank	Negative validation	Behaviour when no bank is selected

Recipient resolution	Functional validation	Correspondence between account number, bank and displayed name
Amount field	Boundary-value analysis	Below ₦100, ₦100, valid amount, ₦5,000,000 and above ₦5,000,000
Preset amounts	Functional validation	Correct value inserted when each displayed preset is selected
Remark	Optional-field validation	Empty, typed remark, Purchase and Personal
Reminder	Data-consistency testing	Recipient, bank, account and amount accuracy
Recheck	Navigation testing	Return to editable transaction information without data corruption
Payment review	Data-consistency testing	Recipient, bank, amount, fee and payment-method accuracy
Payment PIN	Authorization check	Transfer cannot complete before valid authorization
Transaction outcome	State validation	Clear status after the controlled transfer
History	Record-consistency testing	Agreement between submitted transaction and recorded transaction

No test case will be marked as passed based only on what is expected from a banking application. The actual OPay response must be observed and recorded.

7. Test Environment

Component	**Confirmed or Planned Configuration**
Application	OPay
Application Version	8.12.1.474
Device	Samsung Galaxy S21+
Operating System	Android 12

User Account	Uthman Adewale's authorized OPay account
Selected Journey	To Bank
Controlled Destination	Authorized account at another Nigerian bank
Captured Destination Bank	Momo Payment Service Bank
Planned Successful Amount	₦100.00
Displayed Amount Range	₦100.00–₦5,000,000.00
Captured Fee	₦0.00
Authorization Method	Payment PIN
Connectivity	Mobile data or Wi-Fi
Evidence Method	Android screenshots and screen recording

The fee observed in the screenshot will not be treated as a permanent OPay fee. The fee displayed during execution will be recorded as the actual result for that transaction.

8. Controlled Test Data

Testing will use:

- One valid, authorized 10-digit recipient account.
- The corresponding destination bank.
- Blank and incomplete account-number inputs.
- Non-numeric characters where the field permits entry.
- Amounts below, equal to and above the displayed boundaries.
- ₦100.00 for the controlled successful transfer.
- One short capstone-specific remark.
- The displayed Purchase and Personal options.

The final document will use masked test data. It will not disclose:

- Payment PIN.
- Full OPay account number.
- Full recipient account number.
- Available account balance.
- Login details.
- Authentication notifications.
- Unrelated recipient information.

9. Entry Criteria

Execution may begin when:

1. This test plan has been approved.
2. The detailed OPay test cases have been prepared and reviewed.
3. OPay version 8.12.1.474 is available on the Samsung Galaxy S21+.
4. The tester can access the authorized OPay account.
5. An authorized destination account has been confirmed.
6. Sufficient funds are available for one ₦100 transfer and any displayed fee.
7. Screenshot and screen-recording functions are ready.
8. A method for masking confidential information has been prepared.
9. The tester has verified that no confidential value is visible before capturing evidence.

10. Exit Criteria

Testing will be considered complete when:

1. Every approved and safely executable case has been run.
2. Each executed case contains an actual result and status.
3. Relevant evidence has been linked to each result.
4. One controlled low-value transfer has been completed, unless execution is blocked.
5. The resulting transaction status has been recorded.
6. The corresponding History record has been checked.
7. Recipient, bank, amount and fee consistency has been assessed.
8. Failed cases have been retested once where safe.
9. Every observed defect has been documented with reproducible steps.
10. Every unsafe or unexecuted case has been clearly identified.
11. The test summary has been prepared from actual execution results.

11. Test Status Classification

Status	**Application**
Pass	The observed OPay behaviour matches the defined expected result.
Fail	The observed OPay behaviour differs from the defined expected result.
Blocked	An application, account, network or environmental condition prevents completion.
Not Run	The test has not been executed.

Not Applicable	The planned condition is not available in OPay version 8.12.1.474.

12. Defect Reporting

Only issues observed during execution will be reported as OPay defects.

Each report will contain:

- Bug ID.
- Specific defect title.
- OPay version.
- Samsung Galaxy S21+ and Android 12 environment.
- Preconditions.
- Reproduction steps.
- Masked test data.
- Expected result.
- Actual result.
- Severity.
- Evidence reference.
- Reproduction status.

Severity Classification

Severity	OPay Transfer Interpretation
Critical	Transfer to an unintended recipient, unauthorized debit or confirmed duplicate debit
High	Incorrect amount, recipient, bank or fee; debit without a clear outcome; or serious inconsistency in History
Medium	Validation, navigation or processing issue that prevents correct completion without financial loss
Low	Visual or wording issue that does not affect transfer accuracy, authorization or completion

An unclear message will not automatically be classified as a defect. It must first be compared with the defined expected result and reproduced where safe.

13. Evidence Standard

Evidence filenames will correspond with the related test-case IDs:

- TC-OPY-001-01.png
- TC-OPY-001-02.png
- TC-OPY-015-video.mp4

The screenshots already supplied will not be used in their original form because they expose account balances, account numbers and recipient information.

Evidence submitted for the capstone must:

- Show the relevant action or application response.
- Conceal all sensitive financial information.
- Preserve the OPay screen label or validation message being assessed.
- Be linked to one identifiable test case.
- Avoid showing Payment PIN entry.
- Avoid including unrelated recipient information.

Where safe visual evidence cannot be captured, a precise written observation will be recorded.

14. Suspension and Resumption Conditions

Testing will stop immediately if:

- OPay displays a different recipient from the account being tested.
- The amount on the Reminder or payment-review screen differs from the entered amount.
- An unexpected debit occurs.
- One authorization appears to produce more than one debit.
- The account is debited without a clear transaction outcome.
- OPay remains in an uncertain processing state.
- Continuing could expose the Payment PIN or confidential account information.
- OPay displays a service outage or maintenance notice.

Testing will resume only after the account balance, transaction status and History record have been checked and continuing will not create further financial risk.

15. Automation Decision

Automation will not be used against the live OPay application.

Automating this transfer would require interaction with private authentication information and could initiate real financial transactions. An authorized OPay test environment, test account and non-production transaction service are not available.

A separate mock transfer form will not be presented as OPay automation because it would test the mock implementation rather than the actual OPay application.

Therefore, automation is classified as not applicable to this live production assessment. The reason will be documented in the final submission under the brief's requirement for automation "where relevant."

16. Test Limitations

The assessment is limited by:

- Lack of access to OPay's source code and internal requirements.
- Lack of access to a non-production OPay environment.
- Use of one Samsung Galaxy S21+ running Android 12.
- Use of one authorized OPay account.
- Execution of only one controlled financial transfer.
- Inability to deliberately reproduce failed, pending or duplicate transactions safely.
- Possible changes in fees, limits or screen design after OPay version 8.12.1.474.

A failed or pending outcome will be documented only if it occurs naturally during testing. It will not be deliberately induced.

17. Required Deliverables

The project will produce only the deliverables specified in QA-01:

1. Bank-transfer test plan.
2. Test cases, including edge cases.
3. Bug reports based on actual observed defects.
4. Automation decision or script where relevant.
5. Test summary.
6. Two-to-three-minute project video.

18. Approval
